

## Peak Picks Short & Long term GOLD MINER BREADTH OSCILLATORS

**FEB 14, 2014**

**the Long & the Short of IT( the PM  
Complex Rally)**

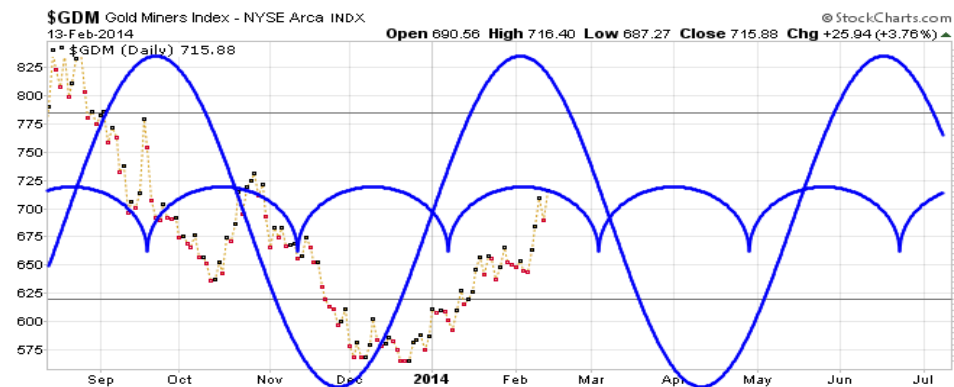

**The Daily we see above Left has the Stochastics built into the chart on top.**

**The Weekly we see above Right has the MACD built into the top of the chart.**

Analyzed from a cyclical perspective I am coming to suspect we will have a bit more top action and then go into a consolidation as if we are skipping a correction which will be very confusing to many.

**Below** you see two cycles that are currently running overlapping on each other. Over time they will lose their synchronization but for now you can see what leads me to think we will have an extended

CONSOLIDATION into March once we hit our Local Top in the next week or two, and then a drop back into the KILL ZONE where the TAX DAY MASSACRE hit last year, in 2013. HOWEVER the BIAS and TREND will be UP, not down, so once that is over, the Rally will resume if I am guessing right. As we go into the last 2 weeks of FEB I

figure for a lot of weakness, followed by Mach which is a bit of a downer but mostly stalemated.

**PEAK PERFORMANCE PICKS**  
**FEB 14, 2014**

You can do your best to buy on down days, but with the way this is moving, too much caution may net you nothing, so be

tempered about GREED. **STOPS** should be set at the **CROSS** over of the **20DMA** and **50DMA** until you have sufficient profit to move them up by the same proportion that existed **BEFORE** from that crossover.

For instance, the last ETF listed, **SILJ** has a cross over 20/50 at just under \$10. Thus the **STOP** is \$2 under the price. To move the stop upward, you would need about a 15% upmove to make it sensible, so a move say to \$13.75, would allow you to move your **STOP** to 12.00 to make sure you capture a profit whatever may happen.

A slightly different approach uses

an existing measure to help estimate your **STOPS**:

The **LIME GREEN** line represents a price level 3 **AVERAGE TRUE RANGES** below the **HIGHEST** price in the last 22 days. You can see how the **AVERAGE TRUE RANGE** is calculated **HERE**. The **ATR** attempts to take volatility into account but in the case of **SILJ** places the stop so high it is unacceptable, as you will likely get shaken out on ANY reaction. The name of this game is "HANG IN THERE".

So to account for this, I'd consider using the **LOWER** of the **TWO**, the **CHANDELIER EXIT** or the **20 / 50 DMA crossOver** for the **FIRST STOP**.

After that its your discretion and comfort zones.

**Dashboard Instruments**

**LINK\$ < CLICK to ACTIVATE**

Instrument Panel, **BULL / BEAR** Instrument Chart Interpretation:

- MACD & Moving Averages** show **DIRECTION**;
- StochRSI & CCI** of **CMF**, show **EXTENT** of Move
- Extremes** of **Stoch RSI & CCI** of **CMF** relent when **MACD** reverses .
- Thus **DIRECTION** continues **UNTIL MACD REVERSES**.
- For analysis, remember that **StochRSI & CCI** are **RELATIVE** measures, **MACD & Moving Averages** are **ABSOLUTE** measures, and will persist in extreme states **UNTIL** the **ABSOLUTE** Measures **CHANGE DIRECTION**

So **MACD** shows which way the trend is going, and **StochRSI** tell you when the **Trend** has been so strong for so long it may begin to lose steam and reverse, for when **StochRSI**, moves out of its "Xtreme Zone" it is a "HEADS - UP Alert" that **ALWAYS HAPPENS before a TREND CHANGE**. One last note: **TRENDS** do NOT always CHANGE when **StochRSI** exits an extreme zone (generally 80 or .8 on the upside & 20 or .2 on the downside).

You may always set a stop limit or buy limit @ the 20/50 DMA Bull crossover, and a STOP order 10% lower than that point.
